Portable photovoltaic power solution supplies off-grid electric power

meeco AG announces the worldwide roll-out of its latest renewable energy solution, “sun2go“. “sun2go“ is an independent, portable photovoltaic solution which supplies electricity generated by the natural power of the sun.

In many remote parts of the world, reliable electric power supply is not yet available. Due to the immense costs, it may never be. Therefore, off-grid and portable solutions are the only way to have electricity in many cases. Until now, the most common off-grid solution has been the fuel-powered generator, a solution which has a high running cost and negative impact on the environment. Now, “sun2go“ offers a professional solution which reduces costs by generating electricity from solar energy, is environmentally-friendly, and is portable for a wide range of settings, from professional application in off-grid areas, humanitarian and emergency situations, to leisure and recreational activities.

Powering small electric devices and tools by using the natural power of the sun is much easier and less expensive than using small fuel-powered generators. Stuart Moss, responsible for global sales and marketing of meeco’s Off-grid Solutions explains: “sun2go does not require re-fueling and requires much less maintenance. Calculated over the economic lifetime of the system, sun2go is the first choice in most cases.”

“sun2go“ delivers 1 kWh storage capacity with a nominal output up to 600 watts DC or 15 amps AC , and can be charged via solar power or the electric power grid. It can provide power several hours a day for appliances such as electric lights, electric power tools, measuring equipment, broadcasting, radio and audio players, laptops, small TV sets or similar small to medium size appliances. The sturdy, rainproof, lightweight, wheeled trolley can be taken anywhere and can withstand tough environmental conditions. Utilizing a combination of German engineering and Swiss quality, the system is simple to operate, durable and reliable, and can be used in a wide range of applications.

“Renewable, portable energy systems such as “sun2go” represent a sustainable solution to address off-grid electric power demand, both for day-to-day use in remote areas as well as for emergency and humanitarian purposes.“ concludes Mr. Moss.

Consolidated in May 2000 in Zug (Switzerland) meeco AG has two main areas of activity:

meeco AG has focused on optimizing the company's grasp in international sales of solutions, products and concepts. From the very first contact with the customer to the implementation of the final project, meeco masters the role of project coordination across continents and sectors with a strong knowledge of technologically oriented products.

meeco AG invests into business opportunities and supports the growth of companies across the globe that are in line with the general business areas of meeco and fit the general idea of corporate development.

meeco's core competence is to offer high-end engineering, management and investment solutions in the areas of Renewable Energy, Reusable Resources, Agrochemicals, Aviation and Sponsorships.

The solutions meeco presents today are the result of years of experience and careers dedicated to development, sales and project management, with a strong focus on renewable energies and resources management / preservation.

meeco's strength has been, long before any other global personal network companies (such as Xing) was around and in business, to establish and use such a network made up by the partners, co-workers and their personal networks to be able to offer optimal tailor-made solutions for each and every customer industrial or domestic, wherever on the globe the opportunity presented itself.

In the last couple of years, meeco has been working very closely together with a+f GmbH, a member of the Gildemeister Group, forming thus a strategic partnership in the solar industry, with the manufacturer of the largest photovoltaic tracking system in the world, the SunCarrier.
