Orga Systems shows ways to a networked home

Paderborn (Germany), 9 March 2010: TV, Internet, heating system and refrigerator - worlds that have been separated so far will in the future determine the seamlessly networked household. In practice, this connection still represents a challenge, particularly as uniform user structures are lacking and individual functions have to be networked in order to achieve an overall solution. In this process, the overriding core issue is the real-time based organization of a complex data transfer. The interdisciplinary innovation centre "Connected Living" is investigating solutions for a practically oriented implementation of this challenge. In the context of the Future Talks at CeBIT 2010, Orga Systems, #1 choice for real-time charging and billing, presented real-time based billing mechanisms by way of which the networked home becomes an attractive alternative for users and service providers.

Real time enables "House of the Future"

Intelligently networked households in the context of an overall technical solution offer more life quality to consumers. Moreover, new sustainable business models for providers in the product and service industry can be developed. Thus new and innovative market opportunities arise because networking technologies and infrastructures creates added-value for the devices and services offered by service providers. Orga Systems, an expert for real-time billing of voice and data services, offers the solution for an individual and flexible billing of new services in a networked home.

30 percent less energy costs

At CeBIT, the focus of media interest was the "House of the future", developed by the innovation centre Connected Living. In this house, heating and ventilation systems and appliances have been networked intelligently by way of digital assistants. The result are up to 30% less energy costs in the living area. Orga Systems, an expert for real-time billing of voice and data services, makes it possible to have an individual real-time based and flexible billing of all services within this networked household.
