Press release from: [YMS Group](#)

TRNAVA, SLOVAKIA, March 11, 2010 – YMS Group is introducing a geospatial information system tailored for local governments – ySpatial – which combines geographic and non-graphic information about the City into one multi-layered system for both the government and the public to use. It aims to provide all information related to any selected object in the city with a simple click on the map.

ySpatial connects maps, aerial images, land use and zone plans with all available information about Cadastre, city assets and city buildings, utility infrastructure, all types of transportation, water areas and waterways, greenery and other objects. A click on the selected object reveals complete information on position, character, relationship to other objects, use, address with contact details or other information as needed.

„A state-of-the-art GIS is an invaluable asset to any local government. We have tailored the well-tested ySpatial to fulfill the needs of cities. Since we already supply a variety of state institutions with our geospatial information systems, taking on the local government market followed naturally“, said Martin Bachorik, the Managing Director of YMS a.s.

For the government, ySpatial creates a single geospatial information system for all departments to access, use and refer to. For the public, ySpatial offers a simple-to-use front office, which displays all public information online without the need to spend time processing it by the city government.

To tailor ySpatial for local governments, YMS Group utilised its twenty years of experience in developing a wide variety of geospatial information systems. The ySpatial is a strong information and analytical tool, which supports spatial operations, multimedia, advanced search, mapping and exporting operations, clarification of object relationships, anticipation of consequences of actions and other options. It can be easily integrated with other information systems.

### About YMS Group

YMS Group has been on the market since 1990 and is a strong player on the market of software development and system integration. The company focuses on geographic information systems (GIS), localisation-based systems (management of mobile forces and mobile devices) as well as special solutions (asset management, enterprise content management, etc.). YMS Groups solutions work as modern and open modular systems, which support integration among one another and enable problem-free interconnection with other information systems.
