Press release from: [Dexcor.Com](#)

New York - April 5, 2007 – Web hosting company, Dexcor, announced today that new Extended Validation (EV) SSL Certificates are available for sale and ready to install. An SSL Certificate is a digital credential that authenticates the identity of a Web site and encrypts information via Secure Sockets Layer (SSL) technology.

Created to establish online business identities, enable secure connections and promote online consumer confidence, EV SSLs set a higher standard for secure and successful online businesses. Like Turbo SSL® and High Assurance SSLs offered by Dexcor, the new Extended Validation SSL Certificates offer industry-leading 256-bit encryption technology. A thorough, standardized verification process affords EV SSL owners an opportunity to tout completion of the most stringent vetting process for SSL encryption available today.

The EV SSL vetting process involves verifying the applying organization's identity and typically requires a letter from a representing attorney or accountant. While the new guidelines are strict, Dexcor EV SSL certificates can be issued within two to four hours after all required documentation is received.

"We are excited about offering our customers Extended Validation (EV) SSL Certificates. Customers conducting business online demand and expect security from their hosting providers," says Daniel Delgaudio, President of Dexcor. "The Extended Validation Certificate provides the highest level of online assurance for our customers."

When users access sites encrypted with EV SSLs using Internet Explorer® 7, the first browser to distinguish EV certificates, the site's secure status is immediately evident. The browser's address bar reflects a green background and the name of the organization to which the certificate was issued, along with the familiar https:// prefix and padlock icon. Other browsers currently handle EV SSLs like normal certificates and are expected to distinguish them soon.
