

## Ident Technology Gera GmbH starts its production of RFID Transponders

Date: 06-18-2007 12:51 PM CET

Category: [IT, New Media & Software](#)

Press release from: [ITG Ident Technology Gera GmbH](#)

Agency: **ITG PR**

Ident Technology Gera GmbH, founded in 2006, has officially begun with the production of so-called transponders, intelligent labels, in historical industrial premises in Gera. The transponders are used in the radio frequency identification technology (RFID) and carry microchips. Processes in production and transport can be easily tracked this way. They also appear in other application fields as well, such as entry tickets for mass events. Six million transponders are expected to be manufactured here this year. Two million Euros are being invested in this location featuring state-of-the-art converting machinery. Alongside the production at ITG, GiS Gera.ident-Systeme GmbH is developing RFID software.

ITG Ident Technology Gera GmbH consists of highly experienced and highly motivated employees. The organization is entirely committed to the RFID technology, emphasising primarily on the manufacturing and development of transponders.

ITG is founded as a manufacturer of a number of customized and specialized products, as well as of the more conventional range of tickets, tags and labels. This philosophy demands comprehensive and diverse machinery that makes it possible to better serve the clients. The company exerts significant influence on the enhancements of its machinery meaning the development and technical preparation of certain components and assembly groups.
