Press release from: spy-phone.com

Technology available only for Law Enforcement.

- * Software based technology requires physical access to device.
- * Technology can be managed remotely once installed.
- * Works on GSM phones only.

London, June 24, 2007. A new software based technology termed, Phone Dead, developed by spy-phone.com has been released which allows Law Enforcement agencies to listen room conversations even when a phone is switched off. It takes less than 10 seconds to configure a phone for such monitoring which can be then managed remotely by sending an SMS.

The converted phone will only answer calls from a specified phone number and answer it when the phone is in switched off or "Phone Dead" mode. An agency can send a silent SMS to the converted phone to activate, deactivate or change the pre-defined number without any alert messages on the phone. Another noticeable feature of this technology is that calls coming from other numbers will be able to listen to a phone switched off message so that there is no suspicion to a normal caller.

This technology is high end, but is not magical. Installation requires physical access to the device, so this is not a mass market product but has its niche uses. The company that developed the software (spy-phone.com) declined to discuss remote installation processes by sending the software as a SMS as they are strictly meant for law enforcement.

www.spy-phone.com develops specialized products for law enforcement agencies, some of which are available for viewing on their website.
