Press release from: [TS-Market Ltd.](#)

A new deep look at the alternative source of energy: Combined with Li-Pol batteries, the Solar ones will certainly make a breakthrough

Russia, August, 19 - Since the mankind got acquainted with the solar energy, it was considered to be a very promising alternative source. Then there appeared batteries of various dimensions, first of all to collect and preserve this new type of energy. The next step was to learn how to use it and solar batteries began to be implemented into various devices.

Since then this solar-evolution has touched different spheres of electronic kingdom. Recently a new step has been made by the Russians who focused on the sphere of professional voice recording and launched workaholic creatures to the global market.

In particular, TS-Market Ltd., a Russian supplier of professional voice recorders, is quite satisfied with its Solar model of digital tiny voice recorders. The combination of Li-Pol and solar batteries inside the tiny case should be considered a successful one for many reasons. It has expanded the horizons and allowed the device to acquire a desirable multifunctionality. Thus it has become possible to cover another sphere of usage – Security and Surveillance. Equipped with external microphone this professional voice recorder has turned into a 24-hours-a-day-watchful ear which seems to be more competitive in the electronic market than non-solar devices of the same class.

According to such a tandem of batteries this tiny voice recorder transforms into another device preserving its key feature – very low power consumption. In fact, it is enough 6 hours a month of direct sun beams for it to work smart and power its Li-Pol battery. Even electrical beams can make it work as a tiny black box. So, growing interest and positive response from both common citizens and governmental structures show quite clear that the experiment was worth making.

Yet, this is just one example of how solar energy gains its popularity with manufactures on and on around the globe. Still there's enough sun and a load more workaholic creatures will appear soon as the solar-evolution continues.
