Category: [IT, New Media & Software](#)

Press release from: [Beatenetworks](#)

Beatenetworks, a leading full service provider of solutions for the 3d web, today announced a new in world Content Management System product for users of Second Life. The product, named the InventoryButler, allows Second Life users to store inventory assets into a virtual organizer and to retrieve specific items on command. The system is designed to reduce inventory retrieval time and total overall inventory asset load, and is especially beneficial to business owners who have a large number of items that they need to manage in world.

The CEO of Beatenetworks, B. Koenig said "one of the main things that business users have lacked inside Second Life is a robust CMS (content management system). We are pleased to offer the first and best solution for managing content in world, and we look forward to adding new features to the system over time."

A fully functional demo is available in world. For more information, visit the Beatenetworks website www.beatenetworks.com
