

## **FabulaTech launches USB over Network 3.4.6. The program is ready for download**

Date: 08-08-2008 04:14 PM CET

Category: [IT, New Media & Software](#)

Press release from: [FabulaTech](#)

FabulaTech, the software development company which specializes in device driver development, application development and systems internals programming for Microsoft Windows, Linux and Embedded operating systems has launched the new version of USB over Network with the minor bugs being fixed and enhanced user interface and program workflow.

The program allows to work with the remote USB devices over a local network or Internet as if they were connected directly to one's local PC. This functionality can be easily integrated into any software.

“Usually, when you need to use any USB device (like scanner, flash-memory, etc) you plug it into USB port of your computer. But for all that, the device is accessible only for the computer it is plugged into. And what if someone else needs to use the same USB device?”, comments Alan Rurke, one of the program's developers. “You can unplug USB device from your PC and give it to another user, but according to different circumstances, not always there is a possibility to give USB device to another user, even for a while; or you can allow another user to work with that device on your PC but sometimes it is not possible to allow someone else to work with that USB device on your PC (especially if another user is in the another office, city or country). It is possible to purchase the same USB devices additionally but additional USB devices could be purchased but it depends on the cost of the device and quantity required.”

“FabulaTech has resolved this problem in a different extraordinary way”, adds Gregory Forge, the developer, “We've created USB over Network which allows to work with remote USB devices over a local network or Internet. All you have to do is to install USB over Network Server on the PC where USB devices are plugged in. USB over Network Client must be installed on the PCs you want to give access to those very USB devices you've already plugged in. That's all”.

USB over Network Client is free software. One can purchase the license of USB over Network Server, install it on PC where USB device is plugged in and unlimited number of users will be able to work with that USB device.

USB over Network is available for Windows and Linux operating systems. For more information visit [www.usb-over-network.com](http://www.usb-over-network.com)
