

## CardioSec uses magnetic capsule in clinical trials

Date: 06-16-2009 03:14 PM CET

Category: [Health & Medicine](#)

Press release from: [CardioSec Clinical Research](#)

The magnetic capsule, a segmented capsule held together by magnetic forces, is used to deliver drugs to any targeted location in the gastro-intestinal-tract.

The way the capsule takes is monitored on a PC screen. As soon as the capsule has reached its destination, the magnetic field is destroyed by pressing a button and the drug is released for resorption within milliseconds.

The method is used during development or optimization of drug products and contributes significantly to the reduction in development time and costs.

Areas of use include the determination of resorption windows, early Proof of Concept studies, interaction studies, and optimization of pharmaceutical formulations.

CardioSec is a Contract Research Organization. Its team has sound experience in contract research, pharmacology, the pharmaceutical industry and drug regulatory affairs, is well connected and impacts developments in its working areas. The organization offers services far beyond the usual standards.
